

# Billing from ISP Data

Users in New York can now use ISP Data to record multiple service contacts during a day or during the month. Users can also utilize Therap's bundling rules to create accurate billable units and generate Billing Data for multiple individuals from

ISP Data. When creating ISP Data, if a task is marked as Billable, bills can be generated and sent based on the total duration of the particular tasks performed. Users

can also review their Bills before generating them to be sent to the State Medicaid System.

**James Kelly**  
Vice President  
Therap Services.

In the future, Billing Module will be connected with Individual Plans and then there will not have to be separate documentation for both billing and services. Who provided the services, were the service authorized in the Plan, what was the time in, what was the time out, how many units are you billing and what you have accomplished – will all be recorded. And then you can do a case note as to what was the consumer's reaction to the activity. So you are fully compliant then and the outcomes are documented.

Individual Name	Program Name	Service Authorization ID	Unit Rate (\$)	ISP Program Name	ISP Data
